Weibull analysis is the world's most popular method of analyzing and predicting failures and malfunctions of all types. About 85%-95% of all life data are adequately described with Weibull probability plots. Whereas about 85%-95% of all repair times are adequately described by log normal probability plots. The New Weibull Handbook provides practical tools for analyzing life/repair data.

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.

Extreme value distributions are limiting or asymptotic distributions that describe the distribution of the maximum or minimum value drawn from a sample of size n as n becomes large, from an underlying family of distributions (typically the family of Exponential distributions, which includes the Exponential, Gamma, Normal, Weibull and Lognormal).When considering the distribution of minimum ...

A Q-Q plot is a plot of the quantiles of two distributions against each other, or a plot based on estimates of the quantiles. The pattern of points in the plot is used to compare the two distributions. The main step in constructing a Q-Q plot is calculating or estimating the quantiles to be plotted.

In probability theory and statistics, the Poisson distribution (French pronunciation: ; in English often rendered  ⁠ˈpɔʊsˈn /), named after French mathematician Siméon Denis Poisson, is a discrete probability distribution that expresses the probability of a given number of events occurring in a fixed interval of time or space if these events occur with a known constant rate and ...
